

Alien Stock Sim

Yunqi (Kate) Dong, Leyu Ding, Davis Germain

Description

Our game is the Alien Stock Sim! In our game, users will buy and sell stocks as they wish, getting insight into how a certain stock will react given a news flow. The user will be able to browse this news and look through headlines to determine if a stock will go up or down. There are also global and friends leaderboards, so the user can compete with their friends and other players everywhere.

Goals for Sprint #1... and What We Accomplished!

Our goals for sprint #1 were:

- Implementing login/registration
- A main screen with
 - Scrolling text
 - News story box filled with dummy data
 - A stock visualization including
 - Live stock updates
 - % change
 - # of shares held across all players
 - # of players holding shares
 - Leaderboard with dummy data
 - Buying and selling stocks
- A profile screen with
 - Amount of stock held for each company
 - Dummy data placeholders

We achieved all of this, excluding some of the stock visualization! We even went over what we expected and filled a more complete layout of the profile page.

Problems and Next Steps

Because this was the first sprint, we didn't have many problems getting all the groundwork laid out. We did run into an issue with the number of calls we could make to the data visualization API, and we are finding a workout to prevent the same for the stock and news APIs.

For the next sprint, we are aiming to achieve:

- Working friends list
 - Including global & friend leaderboard
- News API implemented
 - Headlines and associated companies included in the news story box
- Finishing up anything leftover from stock API and data visualization
- Possibly swapping to google auth to increase complexity

Note: This list may not be fully fleshed out. We meet every Friday to solidify plans for the coming weekend and week.
